

The Economics of Coastal Erosion: Risks, Costs, Strategies

ASCE EWRI Annual Water Resources Seminar
April 8, 2016

Risk Tolerance

- ≈ Do we want to know the answers?
 - Equity and sustainability implications
- ≈ Are we committed to transparency?
 - All options have to be on the table to gauge the relative benefits of any particular approach to resiliency
- ≈ Are we asking the right questions?
 - Need sound analysis & good data
- ≈ Magnitude of risks
 - Relative to benefits that are vulnerable

Risk-aware vs. Risk-averse

≈ Changing the dialogue

- Research has found that public works directors and water utility managers among the most risk-averse individuals (for good reason)
- Adopting public health approaches to risk analysis strategies and techniques
 - Identify the issues, quantify likelihood and degree of impact, prepare
- All engineering estimates have risk; climate change is another risk

Transparency

≈ Are we ready to look in the basement?

- Political expediency
- Resiliency requires acknowledging the issues

≈ Honesty in options at hand

- Risk-aware vs. Risk-averse
- Compare a full deck of cards

Transparency

Resiliency Options

- ≈ Ownership Based Strategies
 - Conservation/rolling easements
 - Land buy-outs/Planned Retreat
- ≈ Incentive Based Strategies
 - Transfer/purchase development rights
- ≈ Beach Nourishment
- ≈ Armouring/Sea Walls
 - Elevating infrastructure (Seattle model)

Robust analysis

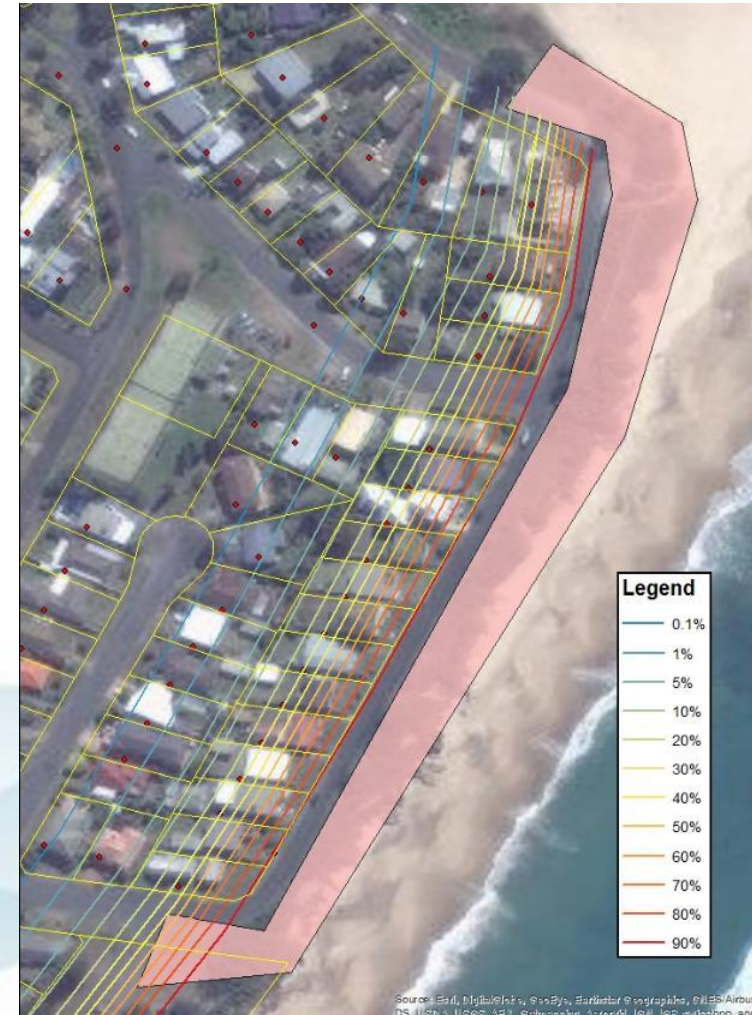

- ≈ Engineering analysis
- ≈ Experienced coastal engineers needed to assess location-specific risks
 - Need sound analysis & good data
 - Hydrogeology and wave energy are different in each community
 - Can't simply move up to the next contour

Robust analysis of risk/hazards

Hazard lines

Probabilistic Risk Profiles

Robust Analysis

- ≈ Economic Analysis
 - Averages mask important outcomes
- ≈ Public values for environmental and social amenities
 - Community uses: intangible value of “beach town”
- ≈ Experienced economists needed to assess nuanced impacts of alternative strategies
 - Market response will reveal externalities eventually

Wide Variation in Results

- ≈ Averages mask important details
- ≈ The cost benefit ratio of Transfer of Development Rights (TDRs) for all parcels in Okaloosa County averages 1.69, while armoring averages 1.15
- ≈ Out of 3,000 parcels in the CHHA, TDR's are viable for all but about 350, while armoring is viable for 1,311

TDRs

Wide Variation in Results

Why This is Important Now

- ≈ Coastal changes over time reflect dynamic processes
- ≈ Impacts are place-sensitive; can't be generalized:
 - Infrastructure
 - Natural Resources
 - Private Assets
 - Quality of Life
- ≈ Shift the focus from costs to benefits

Using Army Corps line

| | Martin | | Okaloosa | |
|-------------------------------------|----------------------------------|--------------------------------|----------------------------------|--------------------------------|
| Number of Cost-effective Strategies | Current CHHA - Number of parcels | Future CHHA- Number of parcels | Current CHHA - Number of parcels | Future CHHA- Number of parcels |
| 0 | 14% | 86% | 3% | 74% |
| 1 | 8% | 3% | 9% | 2% |
| 2 | 29% | 5% | 27% | 4% |
| 3 | 34% | 6% | 41% | 13% |
| 4 | 14% | 1% | 18% | 5% |
| 5 | 0% | 0% | 1% | 1% |
| | 100% | 100% | 100% | 100% |

Changing the Dialogue

- 1.1 – Base Case, Business as Usual
- 2.2 – Planned Retreat: Opportunistic Purchase
- 2.3 – Planned Retreat: Acquisition Yr 1
- 2.4 – Planned Retreat: Easement Acquisition Yr 1
- 3.1 – Beach Nourishment: Move PRP
- 3.2 – Beach Nourishment: Hold PRP
- 4.1 – Revetment
- 4.2 – Revetment & Limited Beach Nourishment
- 4.3 – Revetment & Beach Nourishment

Changing the Dialogue

Adaptive management

- Shifting costs into future budgets limits options available to future generations
- Helps establish current priorities for funding

Equity and sustainability considerations

- Intergenerational transfers warrant different discount rates
- Different time frames for analysis

Coastal Erosion Risks

- ≈ Perceived risk is spending money unnecessarily
- ≈ Actual risks are values that drive economy
 - Beach-related activity and commerce
 - Insidious costs –transportation routes, municipal services infrastructure, institutional assets
 - Increased Maintenance and Repair
 - Relocation of Coastal Infrastructure
 - Business interruptions
 - Increased materials costs
 - Enhanced drainage systems
 - Design Specs/Materials design to withstand adverse weather conditions

Magnitude of Risks – Loss of Benefits

NC study found that property values drop 30% with loss of beach width in a community GA study found that nonmarket values (value of beach for recreation, aesthetics, and other use and non-use values) exceeded value of property by orders of magnitude

Source: Landry (Univ of Md), Keeler (E Carolina), Kriesel (UGA), 2003. Economic Evaluation of Beach Erosion Management Alternatives

Cost-Benefit Analysis: Findings in Florida

- ≈ Properties near amenities have greatest current flexibility to pursue multiple avenues of coastal resiliency
 - Amenities include beaches, open land, conservation areas and parks
 - Those properties contribute most to assets that communities value highly
- ≈ Land use type is not as important to benefit-cost ratio as location of the parcel
- ≈ The retirement or relocation of development rights offers a powerful tool for coastal resiliency
 - But only if development rights are treated as a valuable resource by the community

- 2 to 3
- 4 or more

Current ^

Future >

Florida Findings: Strategies

- ≈ Ownership-based approaches (property acquisition and rolling easements) have the highest returns, but have fewer applicable candidates
- ≈ Incentive-based strategies (TDRs and PDRs) are a good option for most property types and parcels
 - Flexibility in regulations is key to success
- ≈ Physical protection showed positive benefit ratios, but no parcels showed high returns

Broader Implications

≈ Bloomberg article – Foreign Affairs

- Cities are key to managing climate change
- Incorporating resiliency into plans
 - Planting trees & mangroves
 - Modernizing transportation - bike-sharing programs, electric buses, fuel-efficient taxi fleets
 - Retrofitting existing buildings with LED lighting
- Attracting private capital
 - Companies are becoming more eager to provide capital for infrastructure projects for a share of the resulting revenue

Thank you!
